same transmission link can be configured within the transmission frame comprising a first processing unit (Processing unit including FIFO 83) for readout from a current time slot and different current state parameters of the current time slots for intermediary storing state parameters of a time slot following the current time slot and for intermediary storing readout data of the time slot in a first memory unit (current time slot is temporarily stored in FIFO memory 83), a second processing unit (processing unit including FIFO 104) with an allocation unit for administering a second memory unit (FIFO 104) in which said state parameters read from the first memory unit given a time a slot change are stored for editing the state parameters intermediary stored in the first memory unit (values are continuously compared to registers pre configured with of time slots assigned) and for allocation of the data of the current timeslot intermediary stored in the first memory unit into a third memory unit (FIFO 112) and a third processing unit for forming data words from the data deposited in the third memory unit (processing unit including FIFO 112), as in claim 8-9.
